INSTITUTIONAL REVIEW PACK | 28 OCTOBER 2026

Mineral governance. Lasting public value.

Capability statement, source-reviewed leadership profile and illustrative ASM diagnostic and operational framework.

Beldium Consultancy brings mineral supply-chain intelligence and operational design to institutional questions: how formalisation can support viable participation, how public systems can become more accountable, and how mineral value chains can contribute more to development.

The decisions we help structure

Institutional priority	Proposed advisory contribution
Viable formal participation	Assess incentives, administrative barriers, production records and formal market-access pathways.
Capable public institutions	Map responsibilities, workflow gaps, verification requirements and implementation dependencies.
Responsible mineral trade	Assess quality, custody, aggregation and market information along the mine-to-market journey.
Credible development programmes	Define intervention logic, phased delivery, safeguards and measurable indicators.

Institutional fit

Government ministries, mining and trade agencies, development finance institutions, development partners and programme implementation units. Each engagement is scoped to its terms of reference, country context and procurement requirements.

Contact: partnerships@beldium.com
Website: consultancy.beldium.com
Base: Lagos, Nigeria. Africa-focused advisory.

Beldium-authored material. No development-bank endorsement, contract award or completed national implementation is claimed.

CAPABILITY STATEMENT | 2 OF 2

A defined contribution. A mandate-specific team.

Institutional clarity about scope, identity and evidence.

Proposed workstreams

• ASM institutional and regulatory diagnostics, stakeholder mapping and formalisation pathways.

• Traceability, production-recording and digital verification requirements.

• Quality assurance, aggregation, logistics, processing and formal offtake analysis.

• Operational frameworks, capacity-development needs and implementation roadmaps.

• Programme coordination, results frameworks and stakeholder validation.

Engagement structure

The earlier ASM EOI positions Cosmic City Enterprise as the submitting institution and coordination lead, with Beldium Ltd as an associated technical contributor. They are separate entities. The contracting party, role allocation and eligibility must be established for each procurement.

The EOI records Cosmic City Enterprise as BN 8190057, registered 17 January 2025, and Beldium Ltd as RC 9474465, incorporated 9 April 2026. These particulars were reviewed in the supplied EOI; no fresh registry verification has been performed for this pack.

Capability maturity and evidence

Category	How to assess it
Developing technical model	Beldium supply-chain architecture and prototype workflows inform proposed analysis. They are not presented as commissioned national systems.
Individual background	The founder profile is grounded in the supplied CV and EOI. Qualifications and assignment references require primary evidence for procurement.
Specialist coverage	Mining policy/law, mineral economics, country research and safeguards expertise should be appointed against the mandate. No unconfirmed person or firm is listed as a partner.
Comparable assignments	No completed comparable ASM contract has been verified for this pack. Bid submission and outreach are not delivery references.

LEADERSHIP AND EXPERTISE

David Ebube Obi

Founder-led mineral supply-chain systems design and institutional coordination.

Documented role and focus

The supplied International Consultant CV identifies David as Founder and Chief Executive Officer of Beldium Inc., November 2025 to present, and Cosmic City Enterprise, 2021 to present. The EOI proposes him for institutional coordination and digital supply-chain systems support. The CCE activity start in the CV predates the registration date recorded in the EOI; legal registration and professional activity should be distinguished.

Relevant areas described in the CV include procurement workflow design, multidisciplinary coordination, supplier engagement, logistics and warehousing systems, stakeholder engagement and development-tender preparation. Beldium work concerns a developing mineral-supply-chain platform.

Verification boundary

This profile has been checked for consistency with the supplied CV and EOI, not independently certified. Broad years-of-experience and academic claims are omitted from this public summary pending primary verification. No completed AfDB assignment, national ASM deployment or confirmed specialist consortium is attributed to David or Beldium here.

Specialist roles required for an ASM mandate

Role to appoint	Evidence to obtain before nomination
ASM policy / mining-law lead	Relevant country assignments, qualifications, references, language capability and availability.
Mineral economist / market analyst	Evidence of value-chain economics and formal-market assessments.
Environmental and social specialist	Relevant safeguards, occupational risk, gender and inclusion experience.
Country research / stakeholder lead	Local context, language skills, fieldwork methods and institutional access.
Data / traceability specialist	Workflow design, verification, data governance and interoperability experience.

These are role specifications, not named or contracted experts. Signed consent, conflict declarations and availability must precede use of individual credentials.

ILLUSTRATIVE ASM DIAGNOSTIC | 1 OF 4

Define the question. Build the evidence.

A reusable assessment instrument. No country findings, field observations or performance results are asserted.

Decision question

What combination of institutional changes, participation incentives, safeguards and market arrangements could make formal ASM participation viable and implementable in the selected context?

Diagnostic lens	Evidence and consultation	Decision use
Legal recognition	Applicable laws; permits; fees; timelines; miner and regulator interviews.	Identify legal pathways, constraints and administrative burden.
Institutions	Mandates; staffing; process maps; budgets; reporting arrangements.	Assign responsibilities and capacity priorities.
Livelihoods and incentives	Costs to participate; selling arrangements; payment delays; inclusion barriers.	Test the proposition offered by formal participation.
Production and custody	Existing registers; batch records; receipts; assay and transport documentation.	Specify proportionate verification and traceability requirements.
Formal market access	Buyer requirements; aggregation economics; quality and logistics constraints.	Identify feasible commercial pathways and evidence gaps.
Safeguards and inclusion	Hazard records; consultation; grievance channels; gender and vulnerable-group barriers.	Identify mitigation needs and specialist follow-up.

Evidence protocol

Record source, date, geography, collection method, consent/access conditions and confidence for every material finding. Separate observation, stakeholder perception and analyst inference. Triangulate contested claims. Restrict personal data and sensitive site information to authorised users.

ILLUSTRATIVE ASM DIAGNOSTIC | 2 OF 4

Move from evidence to prioritised options.

Scoring supports structured discussion; it is not a substitute for legal analysis or field validation.

Assessment rubric

Rating	Interpretation
0 - Not evidenced	No reliable information available; treat as an evidence gap, not proof that a system is absent.
1 - Fragmented	Activities or records exist but responsibilities, coverage or verification are inconsistent.
2 - Defined	Responsibilities and processes are documented; implementation and results need further validation.
3 - Functioning	Evidence supports consistent use and accountable review in the assessed setting.

Use a separate confidence label (low / medium / high), with a written rationale. Avoid averaging incomparable categories into an unsupported national ranking.

Illustrative issue-to-action record

Field	Example entry - hypothetical
Issue to test	Participants may face high administrative costs relative to expected benefits.
Evidence needed	Fee schedule; travel/time estimates; participant interviews; rejection and completion records.
Options to assess	Simplified steps; assisted registration; phased requirements; links to market-support services.
Accountability	Competent public authority owns regulatory decisions; delivery partners support agreed activities.
Decision gate	Proceed only after legal review, affordability testing and institutional validation.

Prioritisation method

Compare options for expected development relevance, legal feasibility, participant affordability, institutional capacity, safeguard risk and implementation cost. Document trade-offs and dependencies. Do not assign benefits or budgets without a defensible evidence base.

ILLUSTRATIVE OPERATIONAL FRAMEWORK | 3 OF 4

Sequence the pathway. Clarify accountability.

An indicative 12-week assessment design, adaptable to the actual terms of reference. Implementation follows a separate approved mandate.

Phase	Indicative timing	Output and review gate
1. Inception	Weeks 1-2	Scope, country/mineral selection, stakeholder map and evidence protocol. Sponsor agrees questions and methods.
2. Diagnostic	Weeks 3-5	Legal/institutional matrices and stakeholder analysis. Technical review tests source quality and gaps.
3. Options	Weeks 6-8	Traceability, market-access and participation options. Validate feasibility, safeguards and capacity requirements.
4. Framework	Weeks 9-10	Roles, sequenced actions, capacity plan and proposed indicators. Sponsor reviews implementation dependencies.
5. Validation	Weeks 11-12	Validation workshop, final report and management brief. Record decisions, disagreements and handover needs.

Operating responsibilities to agree

Public sponsor: mandate, statutory decisions, access approvals and acceptance of outputs.
Technical lead: assessment quality, specialist integration and recommendations.
Coordination function: workplan, evidence register, stakeholder scheduling and reporting.
Miner/community representatives: participation design, validation and feedback.
Market actors: test commercial requirements without implying offtake commitments.

Minimum pilot controls

Before a later implementation pilot: confirm legal authority, consent and access arrangements; define eligibility and exclusion handling; verify mineral and sample records; provide grievance/referral routes; assign incident escalation; establish correction and appeal procedures. Do not automate adverse eligibility decisions from unverified records.

ILLUSTRATIVE RESULTS AND SAFEGUARDS | 4 OF 4

Measure the change. Test the assumptions.

Proposed indicators require agreed baselines, definitions, targets, collection responsibilities and disaggregation.

Indicator	Definition / source	Interpretation safeguard
Registration completion	Completed applications / applications started in the same defined cohort. Administrative records.	Track rejection reasons and exclusions; completion alone is not a livelihood outcome.
Time to recognition	Median elapsed days from complete submission to documented decision. Case timestamps.	Distinguish agency delay from incomplete submissions.
Custody completeness	Sampled lots with all required custody events / sampled lots reviewed. Record audit.	A complete record does not independently prove origin or grade.
Formal sales participation	Defined participant cohort with evidenced formal sale during the observation period. Receipts/records.	Define formal sale locally; examine displacement and selection effects.
Grievance response	Cases acknowledged/resolved within agreed service standards. Case log.	Protect confidentiality; low complaint volume may reflect poor access.

Risk and mitigation priorities

Exclusion: test affordability and assisted access. Data misuse: minimise fields and define permissions. Record fraud: independent checks and discrepancy handling. Institutional overload: phase scope and assess staffing. Market failure: validate demand and avoid promised buyers. Safeguard harm: specialist risk assessment, referral and escalation before rollout.

Reference note

The sample is Beldium-authored methodology. OECD mineral due-diligence guidance informs the distinction between collecting records, assessing risks and managing them. Use does not imply OECD certification, AfDB approval or legal compliance in a specific country.
